Lab - Gather System Information After an Incident

Objectives

- Collect system information after an incident has occurred.
- View logs for potential intrusions.

Background / Scenario

When an incident occurs in an organization, people responsible must know how to respond. An organization needs to develop an incident response plan and put together a Computer Security Incident Response Team (CSIRT) to manage the response. In this lab, you will gather system information and review logs after an incident has occurred. Doing these tasks immediately after the incident is important because any data residing in RAM will be gone when the system is shut down.

Required Resources

PC with the **CSE-LABVM** installed in VirtualBox

Instructions

Step 1: Open a terminal window in the CSE-LABVM.

a. Launch the **CSE-LABVM**.

b. Double-click the **Terminal** icon to open a terminal.

Step 2: Collect volatile information of the compromised system.

In this step, you will create a file called **report.txt** that includes a variety of system information that can be used for incident analysis. This report can then be transferred to a USB drive, emailed, or uploaded to a cloud server to preserve the information. Then the system can be taken down.

a. Switch to the root user with the **sudo su** command. Enter **password** as the root password.

```
cisco@labvm:~$ sudo su
[sudo] password for cisco: password
root@labvm:/home/cisco#
```

b. Enter the **echo** command, and then specify a heading for a newly created file named **report.txt**. Enter the **cat** command to review the new file.

```
root@labvm:/home/cisco# echo Incident Investigator Report > report.txt
root@labvm:/home/cisco# cat report.txt
Incident              Investigator              Report
root@labvm:/home/cisco#
```

c. Enter the **date** command and redirect the date and timestamp to the **report.txt** file. Be sure to use the double angle brackets (**>>**) to append to the **report.txt** file. Otherwise, you will replace the previous content.

Note: To better document the content stored in report.txt, use the **echo** command to add a subheading as shown here for **Start Date and Time**. Each substep will specify a subheading for you to append before you gather information.

```
root@labvm:/home/cisco# echo =====Start Date and Time===== >> report.txt
root@labvm:/home/cisco# date >> report.txt
```

d. Enter the **uname** command to print system information. Use the **-a** option to append all system information to the **report.txt** file.

```
root@labvm:/home/cisco# echo =====System Information===== >> report.txt
root@labvm:/home/cisco# uname -a >> report.txt
```

e. Enter the **ifconfig -a** command and append all network interface information to the **report.txt** file.

```
root@labvm:/home/cisco# echo =====Network Interfaces===== >> report.txt
root@labvm:/home/cisco# ifconfig -a >> report.txt
```

f. The **netstat** command can collect all the network statistics. Enter the command with the options **-ano** to collect data on all sockets (**-a**), IP addresses instead of domain names (**-n**), and information related to networking times (**-o**). Append the output to the **report.txt** file.

```
root@labvm:/home/cisco# echo =====Network Statistics===== >> report.txt
root@labvm:/home/cisco# netstat -ano >> report.txt
```

g. The **ps** command reports a snapshot of the current processes running on the system. Enter the command with the options **-axu** to list every process running on the system (**-a** and **-x**) and in a useroriented format (**-u**). Append the output to the **report.txt** file.

```
root@labvm:/home/cisco# echo =====Processes===== >> report.txt
root@labvm:/home/cisco# ps axu >> report.txt
```

h. The route command lists the routing table currently used by the system. Enter the command with the option **-n** to list IP addresses instead of trying to determine host names. Append the output to the **report.txt** file.

```
root@labvm:/home/cisco# echo =====Routing Table===== >> report.txt
root@labvm:/home/cisco# route -n >> report.txt
```

i. Enter the **date** command and append the date and timestamp to the end of the file to complete the report.

```
root@labvm:/home/cisco# echo =====End Date and Time===== >> report.txt
root@labvm:/home/cisco# date >> report.txt
```

j. Use the **cat** command and pipe the output to the **less** command to view **report.txt** one page or line at a time. Press the **spacebar** to scroll down by page or press **Enter** to scroll down by a single line. Type **q** when finished.

```
root@labvm:/home/cisco# cat report.txt | less

```

Step 3: Analyze different log files and learn their importance.

In addition to capturing information stored in RAM, the system also maintains a variety of logs that you should review after an incident. These log files can also be appended to your **report.txt** file or stored separately off the system in the event the system needs to be wiped. Logs of particular interest include, but are not limited to, the following:

- auth.log - logs system authorization information
- btmp.log - logs failed login attempts
- wtmp.log - logs who is currently logged into the system

a. Use the **cat** command to view the auth.log and pipe it to the **less** command. Press the **spacebar** to scroll down by page or press **Enter** to scroll down by a single line. Type **q** when finished. Your output will be different.

```
root@labvm:/home/cisco# cat /var/log/auth.log | less
Mar 18 21:43:57 labvm sshd[375]: Server listening on 0.0.0.0 port 22.
Mar 18 21:43:57 labvm sshd[375]: Server listening on :: port 22.
Mar 18 21:43:57 labvm systemd-logind[366]: New seat seat0.
Mar 18 21:43:57 labvm systemd-logind[366]: Watching system buttons on
/dev/input/event0 (Power Button)
